Digital Tools & Analytics

EHR & Clinical Systems Advisory

Expert guidance on EHR selection, implementation governance and optimization from a health system that runs these systems every day.

Category
Digital & Technology Advisory

Delivery model
Virtual, Hybrid, Workshop-based

Client need

The EHR is the largest and most consequential technology decision a hospital makes. New hospitals need help evaluating vendors, defining the implementation team and designing workflows before build begins. Existing hospitals face low adoption, documentation burden and workflows that do not match how care is delivered. Requests typically come from the CMIO, CNO, CIO or COO, triggered by vendor selection, implementation planning or clinician dissatisfaction.

Questions we help you answer

- Which EHR is right for us, and how should we organize its implementation?
- How should our clinical workflows be designed before build begins?
- How do we get more value from the EHR we already have?

What you receive

- Vendor evaluation criteria and scorecard (new hospitals)
- Implementation governance and team structure recommendations
- Workflow design guidance and sample future-state use cases
- EHR optimization assessment and prioritized recommendations (existing hospitals)

How it works

Virtual best-practice sessions with Cleveland Clinic clinical informatics experts, review of the client's vendor evaluation, team design or workflow documents, and written recommendations. Optional in-person clinical informatics immersion at Cleveland Clinic.

Phase 1 Best-practice sessions; Phase 2 Document review and recommendations; optional ongoing advisory through implementation.

Expected outcomes

- ✓ Confident, well-governed EHR decisions
- ✓ Clear implementation team structure and roles
- ✓ Improved clinician workflows and reduced documentation burden
