Digital Tools & Analytics

Technology Infrastructure, Interoperability & Cybersecurity

A resilient, secure and vendor-neutral technology backbone where clinical and business systems share data by default and care keeps running through cyber incidents and downtime.

Category
Digital & Technology Advisory

Delivery model
Virtual, Hybrid, Workshop-based

Client need

Hospitals must decide how to host, connect and protect a growing set of systems, from EHR and ERP to imaging and local vendor tools. Hospitals are prime targets for cyberattacks, so security, data residency and tested downtime plans must be designed in from day one.

Questions we help you answer

- Should we build, rent or combine data center capacity?
- How do we connect our systems without costly rework?
- Are we protected against cyberattacks, and can we keep running through downtime?

What you receive

- Current-state architecture, application landscape and security posture review
- Hosting and data center options (build, rent, hybrid) and integration approach (HL7/FHIR)
- Application rationalization and IT standards (existing hospitals)
- Security-by-design recommendations for identity, access, data residency and consent
- Downtime and continuity plan review, with an optional cyber tabletop exercise
- Prioritized risk mitigation recommendations

How it works

Remote architecture and security review, virtual working sessions with Cleveland Clinic experts and written recommendations; optional on-site deep-dive or tabletop exercise.

Expected outcomes

- ✓ Clear decisions on hosting and integration
- ✓ Fewer costly, hard-to-reverse infrastructure choices
- ✓ Security and privacy designed in from day one
- ✓ Tested downtime and continuity procedures
