Digital Tools & Analytics

AI Governance & Responsible AI

Establish the governance, policies and review process to adopt AI safely, ethically and at pace.

Category
Digital & Technology Advisory

Delivery model
Virtual, Hybrid, Workshop-based

Client need

AI tools are entering hospitals through vendors, platforms and staff experimentation, often without a clear process for review, approval or monitoring. Leaders worry about patient safety, bias, privacy and regulatory exposure while wanting the benefits. Requests usually follow a proposed AI deployment or unmanaged shadow AI.

Questions we help you answer

- How do we review, approve and monitor AI tools safely?
- What AI is already in use across our organization?
- Who should make decisions about AI, and on what principles?

What you receive

- AI governance model and multidisciplinary committee design
- Core principles and AI policy recommendations
- AI use-case intake and review process (including model documentation)
- AI inventory / registry approach, including shadow AI
- Bias review and ongoing monitoring framework
- Staff training and patient transparency recommendations

How it works

Virtual best-practice sessions with Cleveland Clinic AI governance leaders, review of the client's AI policies and current use cases, and written recommendations. An optional in-person AI governance roundtable or tabletop review of live AI use cases.

Phase 1 Current AI landscape and governance review; Phase 2 Governance, policy and process design; Phase 3 Monitoring framework and readout. Optional ongoing advisory as use cases are reviewed.

Expected outcomes

- ✓ A functioning AI governance body with clear roles and decision rights
- ✓ A standard intake and approval process for every AI use case
- ✓ Visibility of all AI in use, including shadow AI
- ✓ Ongoing monitoring for performance, bias and unintended impacts
